 $IDS = Infant\text{-}Directed \ Speech, \ ADS = Adult\text{-}Directed \ Speech, \ Prot = Protophones$

A minus sign (-) indicates that no recording was available for the infant at the designated age.

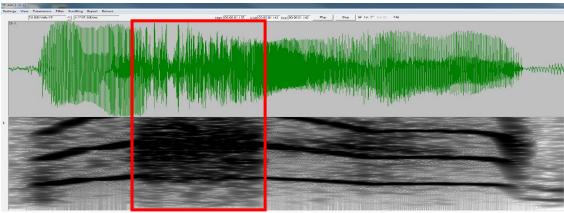

[#] of IDS utterances = total number of utterances of caregivers that were directed toward infants, some of which could be counted as responses to infant protophones or cries, and some of which were continuations of talk by the caregiver.

[#] of IDS responses = Number of caregiver IDS utterances that occurred as responses to infant protophones or cries; only the *first* IDS utterance in each caregiver sequence following the onset of an infant utterance was counted as a response. In addition any IDS utterance starting more than 5 sec after the offset of an infant utterance was not treated as a response.

^a In 18 segments there were NO IDS responses even though there were infant protophones and/or cries and cases of IDS.

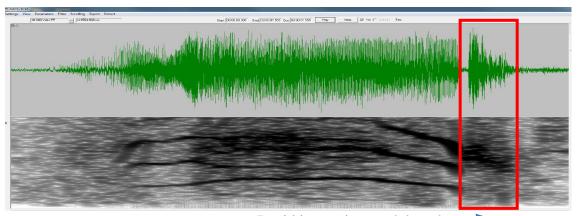

Appendix C

(A) Wail cry (high distress) with a strongly dysphonated portion of its nucleus

Dysphonated portion ~

(B) Wail cry with catch breath at the end of a nucleus including both normally phonated and dysphonated portions

Rapid ingressive catch breath

(C) Whimper (low distress): nucleus and glottal burst
