

Supplementary Material:

Adapting Community Detection Algorithms for Disease Module Identification in Heterogeneous Biological Networks

1 SUPPLEMENTARY FIGURES

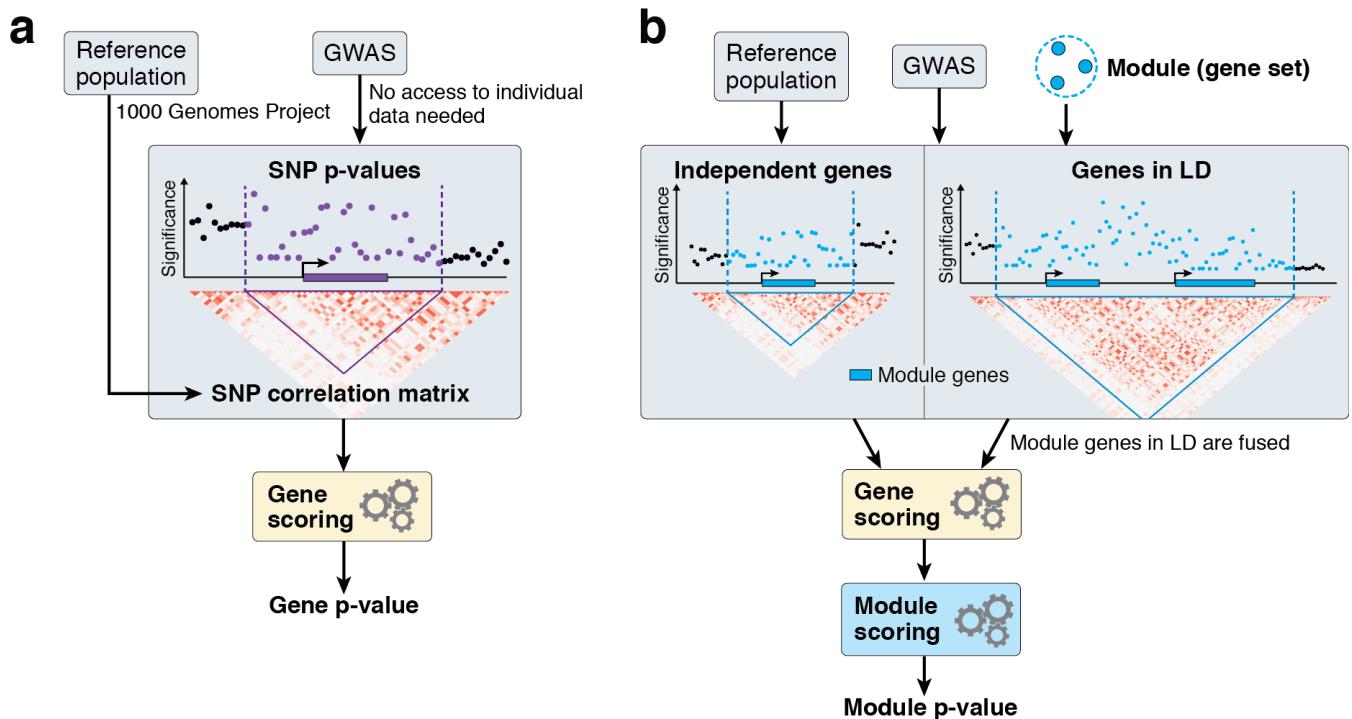

Figure S1: PASCAL scoring tool for computing module enrichment score. This image is licensed under the CC BY 4.0 license and attributed to the synapse website (challenge web-page): <https://www.synapse.org/#!Synapse:syn6156761/wiki/401425>.

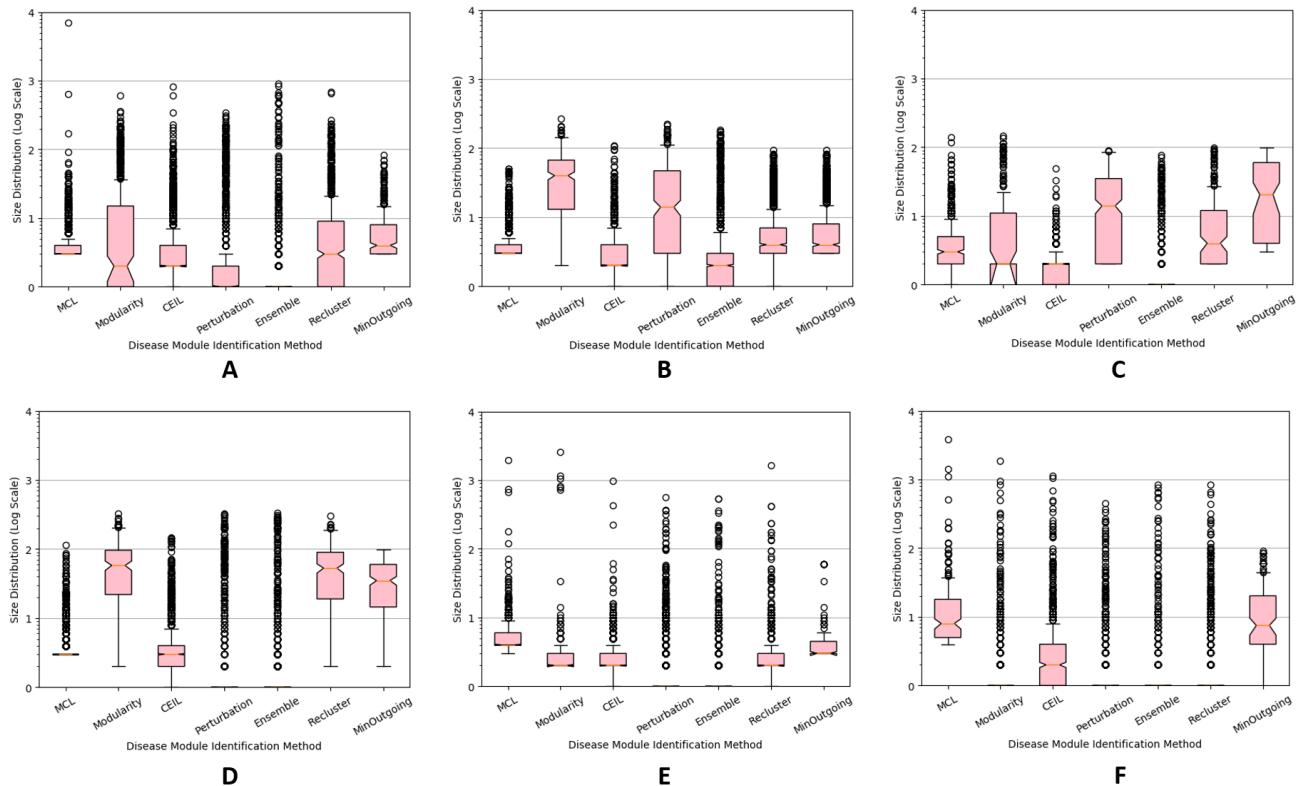

Figure S2: Size distribution of modules generated by non-overlapping community detection approaches on (A) PPI-1, (B) PPI-2, (C) Signalling, (D) Coexpression, (E) Cancer and (F) Homology network.

2 SUPPLEMENTARY TABLES

Table S1. 180 GWAS datasets into 15 broader categories of diseases

GWAS Groups		
Anthropomorphic Neurological Bowel Disease Glucose Metabolism Advanced Macular Disorder	Lipid Bone Mineral Density Psychology Disorder Educational related disorders Blood Pressure	Heart Rheumatoid Arthritis Cancer Hepatitis-C Kidney

Table S2. Hyper-parameter of module identification on simple networks, using off-the-shelf approaches mentioned as baselines and core module identification proposed by us. Hyper-parameter for MCL is inflation (I), modularity maximisation is resistance (R), and all the core module identification methods are applied on baseline method — so the method and their appropriate parameter are shown.

Method	Baselines			Core Module based Methods			
	MCL	Modularity Maximization	CEIL	Perturbation	Ensemble	Recluster	Min Outgoing
Parameter	Inflation (I)	Resistance (R)	None	Method (Parameter)	Method (Parameter)	Method (Parameter)	None
PPI 1	6	0.1	-	Modularity (R=0.1)	All	MCL (I=3)	-
PPI 2	7	0.9	-	Modularity (R=0.1)	All	MCL (I=7)	-
Signaling	2	0.2	-	Modularity (R=0.1)	All	Modularity (R=0.4)	-
Coexpression	3	0.1	-	Modularity (R=0.1)	All	Modularity (R=0.1)	-
Cancer	2	0.4	-	Modularity (R=0.1)	All	Modularity (R=0.8)	-
Homology	2	0.1	-	Modularity (R=0.1)	All	Modularity (R=0.2)	-

Table S3. Baseline methods are tuned over their hyper-parameters which are resistance for Modularity and Inflation for MCI, there is no parameter for CEIL. The values shown represent the number of enriched modules and the total number of modules predicted in brackets. The best results are marked in bold and their corresponding hyper-parameter are present in Table S2.

Parameter		PPI-1	PPI-2	Signalling	Co expression	Cancer	Homology
		Modularity (Resistance)					
0.1		8 (262)	9 (209)	10 (178)	10 (194)	2 (596)	6 (177)
0.2		7 (69)	5 (61)	10 (111)	9 (30)	3 (454)	10 (134)
0.3		5 (8)	3 (31)	8 (87)	4 (5)	4 (308)	5 (79)
0.4		3 (3)	5 (17)	4 (59)	1 (1)	4 (164)	4 (51)
0.5		3 (3)	3 (13)	4 (49)	0 (0)	5 (82)	7 (29)
0.6		2 (6)	4 (13)	4 (49)	0 (0)	7 (52)	5 (20)
0.7		3 (4)	7 (15)	2 (43)	0 (0)	7 (30)	5 (19)
0.8		4 (4)	3 (13)	2 (38)	0 (0)	3 (26)	7 (23)
0.9		2 (2)	3 (12)	1 (36)	0 (0)	7 (19)	7 (22)
1		3 (4)	3 (13)	1 (30)	0 (0)	4 (22)	5 (21)
MCL (Inflation)							
2		12 (152)	10 (1259)	9 (268)	8 (525)	4 (598)	8 (180)
3		17 (547)	15 (1367)	8 (333)	9 (463)	3 (640)	6 (253)
4		14 (738)	16 (1273)	7 (339)	7 (353)	3 (658)	6 (321)
5		15 (822)	15 (1195)	6 (342)	7 (293)	3 (664)	4 (364)
6		16 (872)	18 (1125)	7 (337)	6 (251)	1 (666)	5 (409)
7		14 (857)	17 (1079)	7 (337)	5 (223)	1 (678)	4 (445)
8		14 (859)	17 (1039)	6 (335)	4 (208)	1 (666)	4 (462)
9		12 (870)	13 (1010)	6 (332)	7 (197)	2 (664)	2 (479)
CEIL							
-		12 (1398)	11 (1696)	6 (320)	5 (1336)	5 (831)	7 (320)

Table S4. Comparing unsupervised seed node expansion with known seed node expansion across networks, with the number of seed nodes decided on the basis of disease seed node p -value cut-off. The values shown represent the average number of enriched modules and the total number of modules predicted, averaged across five runs.

<i>p</i>-value		# Seed Nodes	Gold Standard	HITS	Spread Hub
Fraction	Cut-off				
PPI-1 network					
100%	10^{-4}	5436	337 (5433)	170 (4055)	159 (2648)
100%	10^{-6}	3103	266 (3101)	122 (3101)	159 (2648)
80%	10^{-6}	2482	165.8 (2147.6)	94 (2480)	155 (2477)
50%	10^{-6}	1551	111 (1378.4)	54 (1549)	101 (1550)
10%	10^{-6}	310	40 (292.8)	17 (309)	32 (309)
