General information

All reagents were purchased from commercial suppliers and were used without further purification. The reactions were monitored by thin-layer chromatography (TLC) analysis using silica gel (60 F254) plates. Compounds were visualized under UV light. Flash column chromatography was performed on silica gel 60 (230–400 mesh, 0.040–0.063 mm). Melting points were measured with Electrothermal IA9100 apparatus and were uncorrected. The infrared spectra of compounds were recorded on a Thermo Scientific Nicolet iS10. Absorption bands are given in cm^{-1} . ^1H and ^{13}C NMR spectra were recorded on a Bruker Avance II 400 MHz (^{13}C , 100.6 MHz) or on a Bruker Avance DPX 250 MHz (^{13}C , 62.9 MHz). Chemical shifts are given in parts per million from tetramethylsilane (TMS) as internal standard. Coupling constants (J) are reported in Hertz (Hz). High-resolution mass spectra (HRMS) were performed on a Maxis Bruker 4G.

General procedure for the synthesis of compounds **4a-f** and **5a-i**

In a closed vessel containing a solution of substituted 2-aminoimidazole **1** or **2** (1.0 mmol) in PEG-400 (1 mL), aldehyde (1.1 mmol) and ZrCl₄ (0.10 mmol) were sequentially added at room temperature followed by the addition of isocyanide (1.1 mmol). The reaction was heated at 75 °C and 55 °C, respectively, for the ethyl 2-aminoimidazole-4-carboxylate **1** and 4,5-dicyano-2-aminoimidazole **2**. Once the reaction was completed (controlled by TLC), the mixture was poured into water (15 mL) then extracted with ethyl acetate (2 × 15 mL). The extract was washed with water and brine, dried over anhydrous Na₂SO₄, filtered and concentrated under reduced pressure. The crude material was purified by flash chromatography on silica gel using petroleum ether/ethyl acetate mixture (3:2 v/v) as eluent to provide the expected pure products **4a-f** and **5a-i**.

In an open vessel containing a solution of 2-aminoimidazole **3** (1.0 mmol) in EtOH (10 mL), aldehyde (1.1 mmol) and InCl₃ (0.02 mmol) were sequentially added, then the mixture was refluxed at 90 °C. General procedure for the synthesis of compounds **10a, **10b**, **10d**, **10e**, **10g****

In a closed vessel containing a mixture of DCM/TFA (5 mL, 4:1 v/v), 0.15 mmol of **7a**, **7b**, **7d**, **7e** or **7g** was added. The solution was stirred at room temperature for 10 min. After completion of the reaction, TFA and DCM were evaporated under reduced pressure. The mixture was then partitioned between saturated aqueous solution of NaHCO₃ (10 mL) and EtOAc (15 mL). The organic layer was washed with brine, dried over anhydrous Na₂SO₄, filtered and concentrated under reduced pressure. The residue was purified by flash chromatography on silica gel using petroleum ether/ethyl acetate mixture (3:2 v/v) as eluent, or using dichloromethane/methanol mixture (96:4 v/v) as eluent in the case of **10g** to afford the desired pure products **10a**, **10b**, **10d**, **10e** and **10g**.

X-ray analysis of compound 4a

Slow evaporation of an ethanol solution of **4a** yielded single crystals suitable for X-ray crystallography.

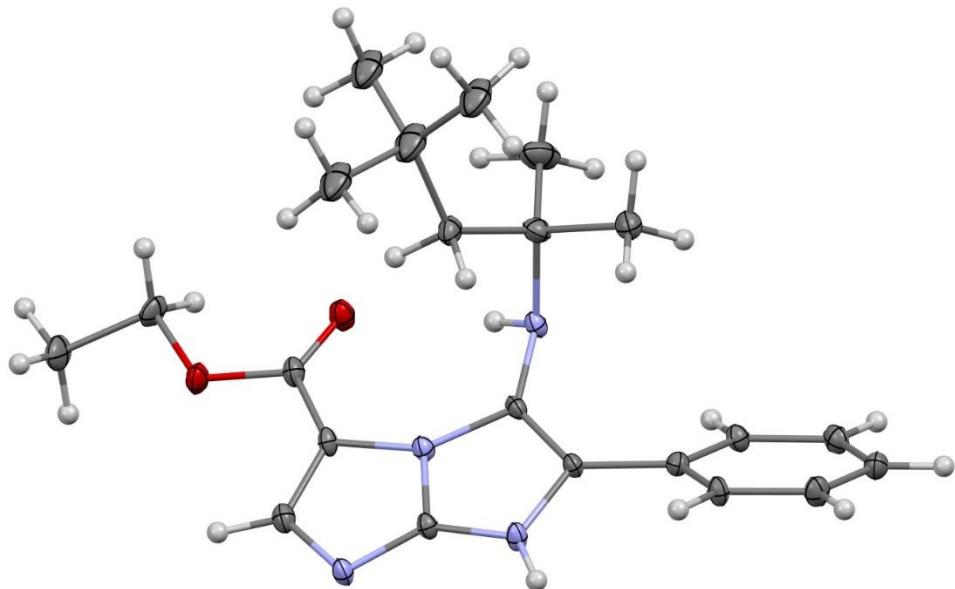

Fig. S01. An ORTEP drawing of compound **4a**. Thermal ellipsoids are shown at the 30% level.

Disorder in *t*-octyl is omitted for clarity.

X-ray diffraction data for compound **4a** was collected by using a VENTURE PHOTON100 CMOS Bruker diffractometer with Micro-focus IuS source Cu K α radiation. Crystals were mounted on a CryoLoop (Hampton Research) with Paratone-N (Hampton Research) as cryoprotectant and then flashfrozen in a nitrogen-gas stream at 100 K. For compounds, the temperature of the crystal was maintained at the selected value by means of a 700 series Cryostream cooling device to within an accuracy of ± 1 K. The data were corrected for Lorentz polarization, and absorption effects. The structures were solved by direct methods using SHELXS-97¹ and refined against F^2 by full-matrix least-squares techniques using SHELXL-2018² with anisotropic displacement parameters for all non-hydrogen atoms. Hydrogen atoms were located on a difference Fourier map and introduced into the calculations as a riding model with isotropic thermal parameters. All calculations were performed by using the Crystal Structure crystallographic software package WINGX.³

The *t*-octyl is disordered over two orientations; the final refined occupancy factors of the two components of disorder are 0.694(4) and 0.306(4).

The crystal data collection and refinement parameters are given in Table S1.
