

Supplementary Figure 1: *Histology of the seizure-damaged hippocampus in the intraamygdala kainic acid model of status epilepticus*

Figure shows representative brain tissue sections (12 μ m coronal) stained by the FluoroJade B technique for irreversible cell death. (a) contralateral and ipsilateral side of a representative section obtained 24 h after status epilepticus and (b) high-magnification of the ipsilateral side showing the CA3-predominant lesion. Image is greyscale inverted thereby showing Fluorojade B-positive cells in black.
