Supplementary Figure S1. Positions of disruptive mutations within the *in silico* translation of *IFIH1* and *ZBP1* pseudogenes of the Malayan pangolin. (A) The pangolin *IFIH1* pseudogene was translated whereby in-frame stop codons and frameshift mutations were marked by “X” on red background (GenBank accession number XP_017517341.1). This theoretical amino acid sequence was aligned to that of human IFIH1. Identical amino acid residues are indicated by blue fonts. Numbers indicate amino acid positions. (B) The pangolin *ZBP1* pseudogene was translated whereby in-frame stop codons and frameshift mutations were marked by “X” on red background (GenBank accession number XP_017505753.1). This theoretical amino acid sequence was aligned to that of human ZBP1. Identical amino acid residues are indicated by blue fonts. Red dashes indicate the absence of the carboxy-terminal protein segment in this prediction. Numbers indicate amino acid positions. Note that additional deleterious mutations that have not been marked by the automatic gene prediction algorithm, are present in the pseudogenes.
