**FIGURE S1 Results of BSM outputs for the other 14 stocks.** A shows the viable r-k pairs found by CMSY method (grey dots) and BSM method (black dots), and the blue cross is the most probable r-k pair with its 95% confidence interval (CI) found by CMSY while red cross indicates the most probable r-k pair and its 95% CI found by BSM. B shows the biomass trajectories (lines) with the 2.5th and 97.5th percentiles (dotted lines) estimated by CMSY (blue) and BSM (red). C shows catch relative to the BSM estimate of MSY, with indication of 95% CI in grey. D shows the development of relative total biomass ( $B/BMSY$ ), with CI (grey area) indicating uncertainty.
