## **Supplementary methods**

The summary of metabolic potentials of different archaeal groups in the Figure 1 were mainly based on previous studies, including Baker et al. (2020) (for *Thaumarchaeota*, *Lokiarchaeota*, and *Thorarchaeota*), Zhou et al. (2018) (for *Bathyarchaeota*), Liu et al. (2018a) (for *Woesearchaeota*), and Zhou et al. (2019) and Zhou et al. (2020) (for MBG-D, MGII and methanogens).

The archaeal community composition for all sites in the Figure 2 were direct retrieved from its original paper without any analysis. Detailed information for sequencing information for total archaea and *Bathyarchaeota* in water and sediment samples (Figure 2 and Figure 4), and archaeal *amoA* genes (Figure 3) can be found in Table S1 and Table S2, respectively.

For the identification of archaeal *amoA* genotypes in each site, all cloned sequences were blast against the database constructed by Alves et al. (2018) using BLASTN, with e-value as 1e-5. For the classification of bathyarchaeotal subgroups for those sites using clone libraries, cloned sequences were blast against the database constructed by Zhou et al. (2018) using BLASTN, with e-value as 1e-5, while the composition for *Bathyarchaeota* in other sites (using high-throughput sequencing) was direct retrieved from the original paper.

The detailed community composition for total archaea (Figure 2), *amoA* genes (Figure 3) and subgroups of *Bathyarchaeota* (Figure 4) were listed in Table S3-35, respectively.

## Supplementary tables

**Table S1 Detailed sequencing information in the Figure 1 and Figure 3.**
