Results of the measured concentrations are reported as medians and 25th – 75th percentiles in children with a latent TB infection (LTBI) and those with active tuberculosis (aTB). The degrees of significance of the differences between the concentrations measured in the two groups of children are reported as *p* values. The diagnostic ability of each cytokine was assessed by receiver operator characteristics (ROC) curve analysis and the areas under the curves are reported in the table. *Mann-Whitney test
