Supplementary Figure 3. **Robustness testing of continuous time trajectories.** Generalized additive mixed models (GAMMs) were built for each cytokine 50 times using 80% of the participants selected at random in each run (grey lines). Spearman's correlation coefficient (*r*) was calculated between each run and the mean value (black line). Cytokines with mean *r* equal to or above 0.9 were considered robust and included for continuous analysis. CRP is measured in μg/mL, cytokines in pg/mL.
