1 Supplementary Figures and Tables

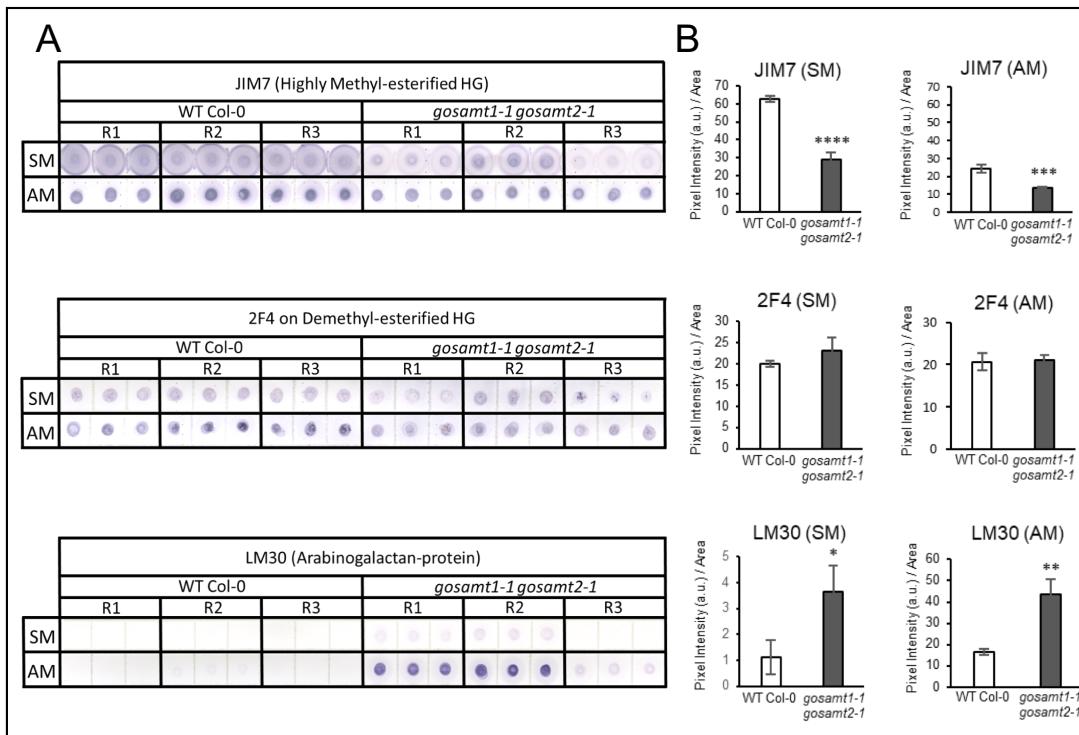

1.1 Supplementary Figures

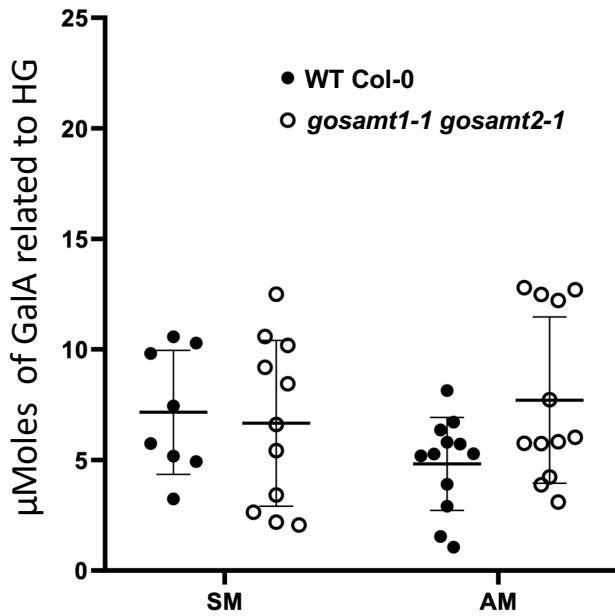

Supplementary Figure 1. Genetic characterization of *gosamt* mutant lines. (A) Schematic representation of *GoSAMTs* gene structure as annotated by the Arabidopsis Information Resource (<http://www.arabidopsis.org>). The sites and orientation of insertion lines in *gosamt1*, *gosamt2*, *gosamt3* lines are indicated by the presence of left border (LB). Numbers indicate the position of different features in bp. Colored blocks represent exon, hatched bars represent 5' and 3' UTR and white black lines represent intron sites. (B) Effect of the *gosamt* mutation on *GOSAMTs* expression. RT-PCR analysis was performed with specific primers amplifying the whole length *GOSAMTs* CDS. A control amplification was performed with primers for EF1 α . All PCR reactions were carried out using 30 cycles. All primers utilized in the present study are listed in Supplementary Table 1.

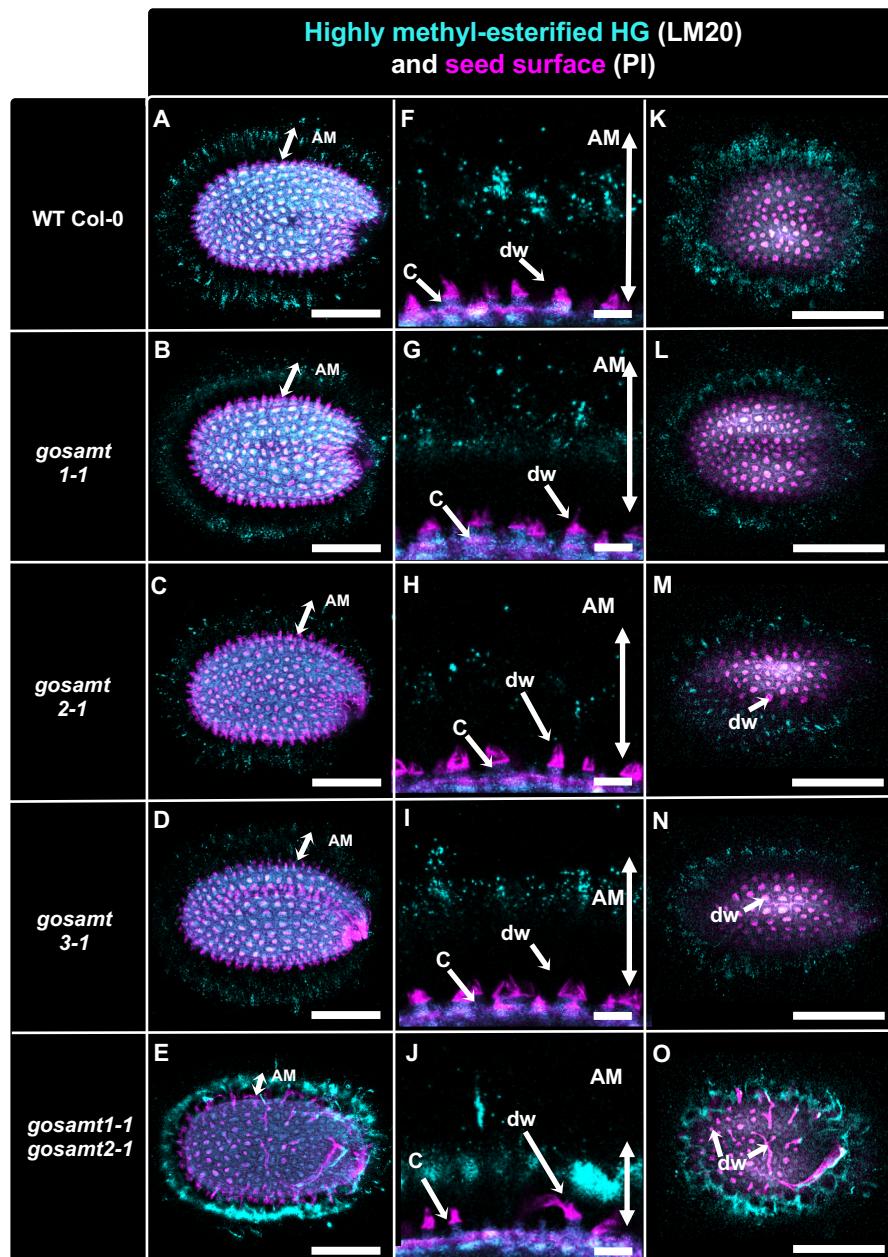

Supplementary Figure 2. Adherent mucilage structure and RG-I labelling with INRA-RU1. (A–J) Ruthenium red staining of WT Col-0; *gosamt* 1-1, *gosamt* 2-1, *gosamt* 3-1; and *gosamt* 1-1*gosamt* 2-1 double-mutant seeds imbibed in water. (K–Y) Confocal microscopy optical sections of unbranched RG-I epitopes in AM released from WT Col-0 and *gosamt* mutants using the monoclonal antibody INRA-RU1 (green), and propidium iodide for seed surface staining (magenta). C = columella; dw = distal cell wall; AM with vertical arrow = labelled adherent mucilage. Scale bars: A–E, K–O, and U–Y = 200 µm; F–J and P–T = 50 µm.

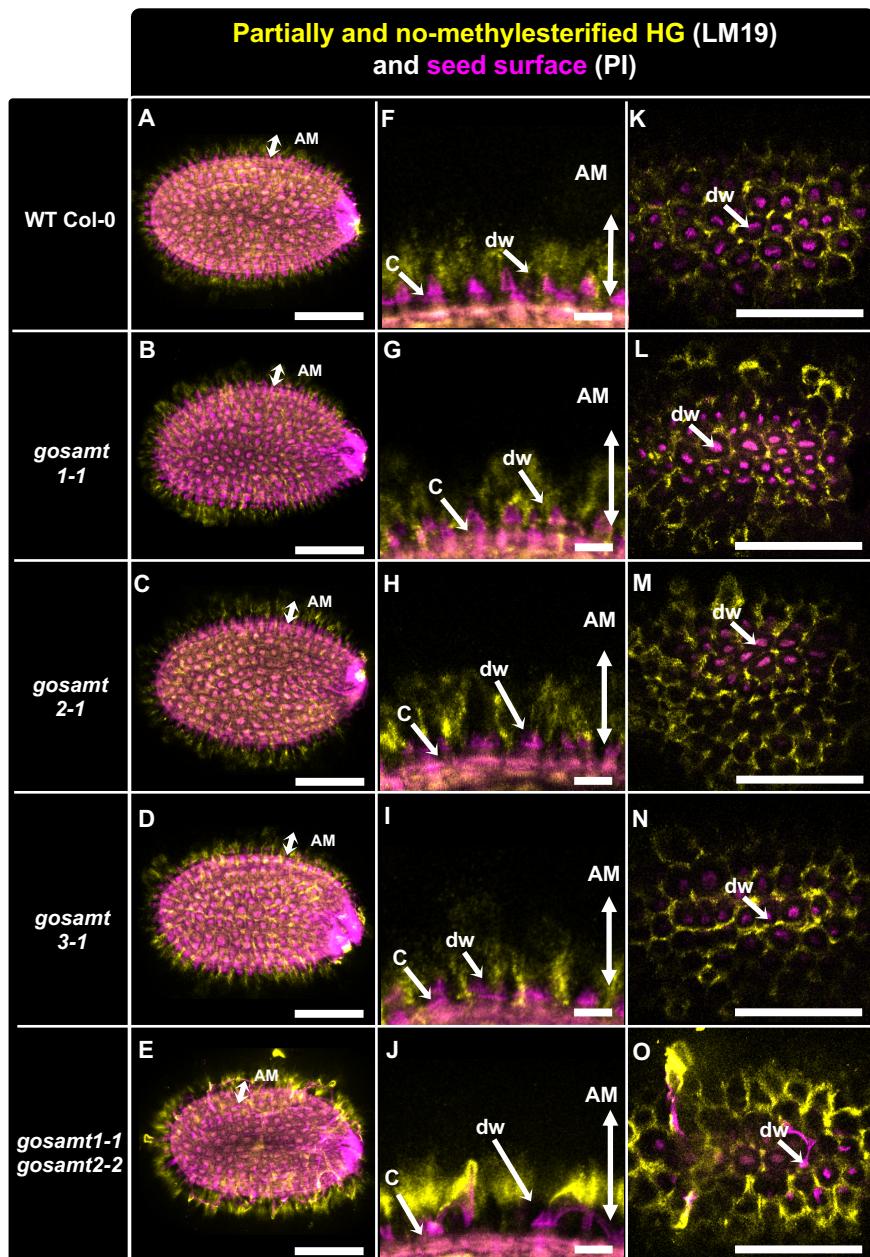

Supplementary Figure 3. Presence of pectin and AGP epitopes on WT-Col-0 and *gosamt1-1 gosamt2-1* soluble and adherent mucilage. (A) Immunodot blots were performed from the same SM and AM samples used in the monosaccharide analysis. (B) Dot blot pixel intensity quantified. Error bars represent SE from three technical replicates of three biological repeats ($n=9$). Asterisks indicate significant statistical differences using *t*-test where $\alpha = 0.05$ ($*P < 0.05$, $**P < 0.005$, $***P < 0.0005$, $****P < 0.00005$).

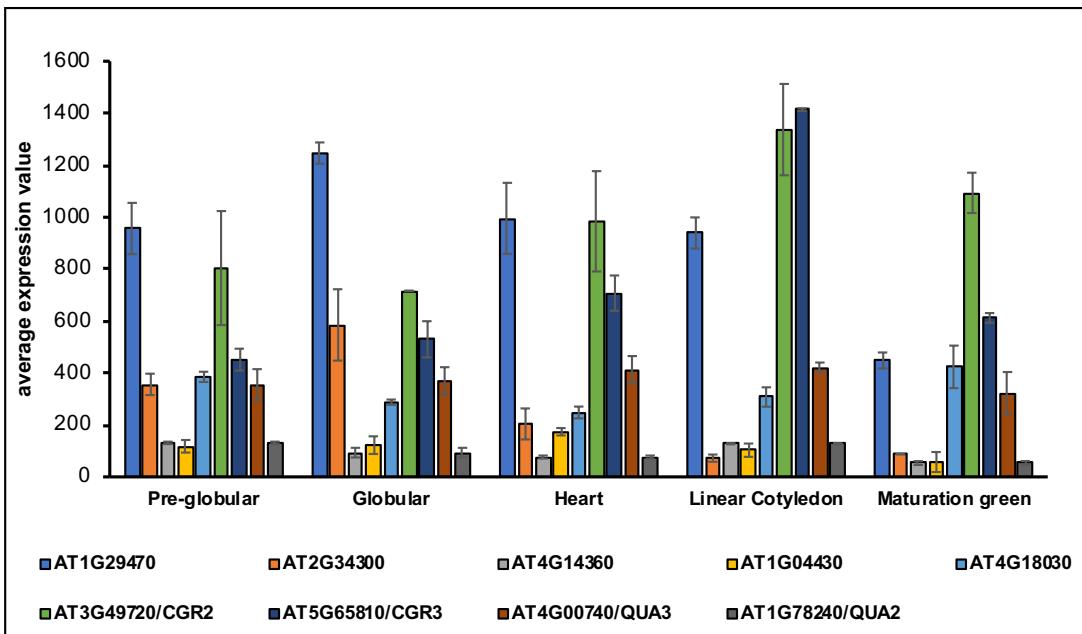

Supplementary Figure 4. Galacturonic acid related to HG is not affected in the *gosamt1-1 gosamt2-1* double mutant. Molar subtraction between galacturonic acid (GalA) and rhamnose was employed to estimate the HG level in mucilage from WT Col-0 and *gosamt1-1 gosamt2-1* double mutant. SM and AM represent soluble mucilage and adherent mucilage fractions, respectively. Data are presented as mean values \pm S.D. from three biological replicates. Black circles and white circles represent values of each measurement in WT-Col-0 and *gosamt1-1 gosamt2-1* double mutant, respectively. No statistical difference was observed using the Mann-Whitney test.

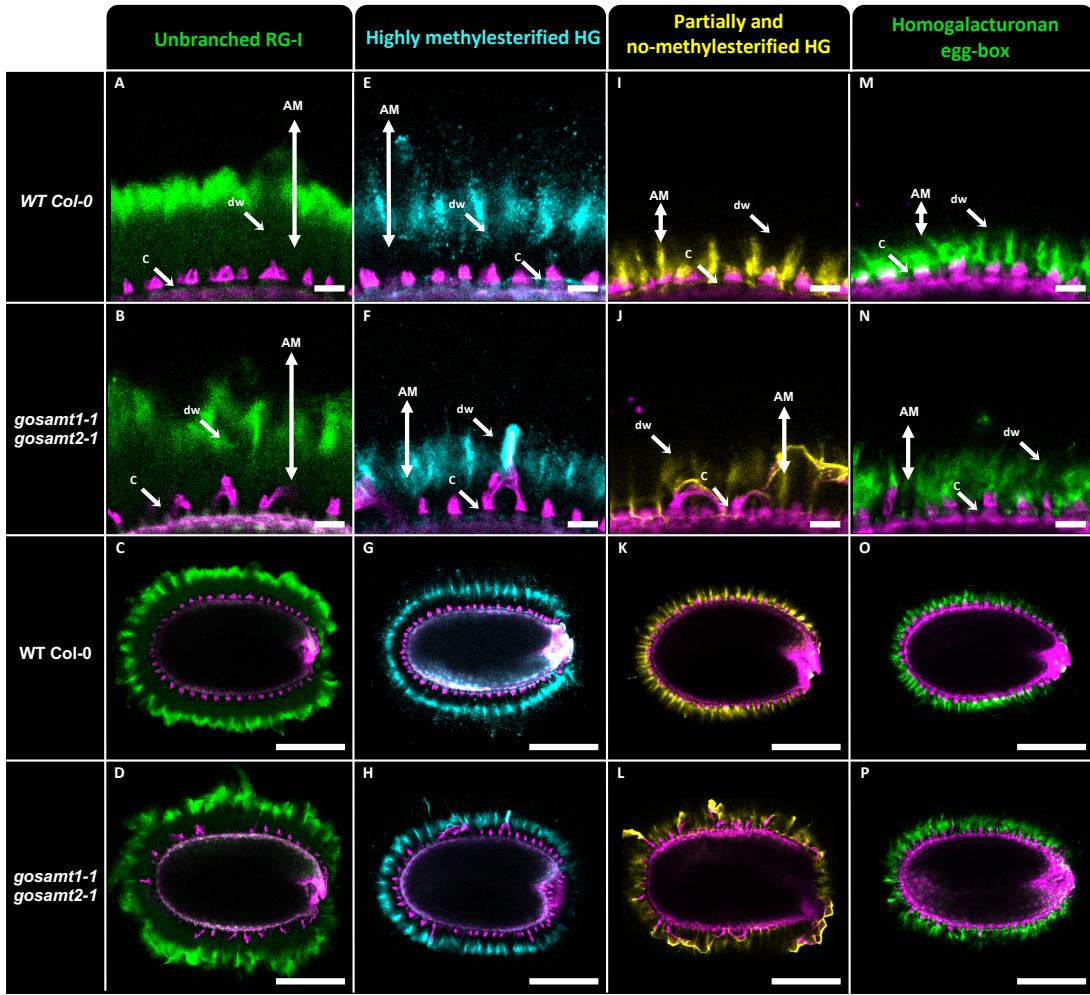

Supplementary Figure 5. Distribution of highly methyl-esterified homogalacturonan recognized by LM20 antibody in adherent mucilage layer of wild-type and *gosamts* mutants mature dry seeds. Confocal microscopy optical sections of AM released from WT Col-0 and *gosamt* mutants mature imbibed seeds. Fluorescence corresponding to LM20 antibody labelling in cyan, and propidium iodide, used to detect the seed surface in magenta. (A–E) Different optical planes showing the whole seed. (F–J) Close-up of columella. (K–O) Top view of seed surface. C = columella; dw = distal cell wall; AM with vertical arrow = labelled adherent mucilage. Scale bars: A–E and K–O = 200 µm; F–J = 50 µm.

Supplementary Figure 6. Distribution of low methyl-esterified homogalacturonan recognized by LM19 antibody in adherent mucilage layer of wild-type and *gosamt* mutants mature dry seeds. Confocal microscopy optical sections of AM released from WT Col-0 and *gosamt* mutants mature imbibed dry seeds. Fluorescence corresponds to the LM19 antibody labelling in yellow, and propidium iodide, used to detect the seed surface, in magenta. (A–E) Different optical planes showing the whole seed. (F–J) Close-up of columella. (K–O) Top view of seed surface. C = columella; dw = distal cell wall; AM with vertical arrow = labelled adherent mucilage. Scale bars: A–E and K–O = 200 μ m; F–J = 50 μ m.

Supplementary Figure 7. Expression levels of putative S-Adenosylmethionine-dependent methyl transferases in seed coat integument. Putative Pectin Methyl Transferases co-expressing with *GoSAMT1* and *GoSAMT2*, according to Temple et al. (2022), were analysed and those expressed in the seed coat, identified. Seed coat expression values during seed development were obtained from the eFP browser.

Supplementary Figure 8. Summary of global changes in HG epitopes distribution between wild-type and *gosamt1-1 gosamt2-1* double mutant. Confocal microscopy of optical sections of AM released from WT Col-0 and *gosamt1-1 gosamt2-1* double mutant from dry seeds. Fluorescence corresponding to INRA-RU1 antibody (green), highly methylesterified HG epitope of JIM7 antibody (cyan), partially and no-methylesterified HG epitope of JIM5 antibody (yellow) and HG egg-box structure epitope of 2F4 antibody (green). Propidium iodide, used to detect seed surface in magenta. C = columella; arrows indicate different epitope pattern distributions. Scale bars: A, B, E, F, I, J, M, and N = 50 μ m; C, D, G, H, K, L, O, and P = 200 μ m.
